These are very important issues, but not urgent right now.

Name	Assign
Optimizing permissions by sending the collection name directly (to reduce complexity). Whatever data we fetch should be passed to the service file to reduce redundant calls. Similarly, for audit logs, the user ID is being fetched again unnecessarily — it should be passed directly from the API handler.	
There are currently multiple clusters they need to be removed.	
After a template is approved, we need to remove the owner's access to the original template by creating a clone. The cloned version should then appear in the marketplace.	
Refactor the permission logic (optional) — the current structure is extremely complex.	
In the filter, we need to check whether concurrency/isolation issues exist or not.	
zod	
Remove the dependency on the workspace ID from every routes.
